

# Contents

<b>1</b>	<b>Introduction</b>	<b>1</b>
1.1	Expensive optimization problems . . . . .	1
1.2	Global optimization methods . . . . .	2
1.2.1	Stochastic and deterministic methods . . . . .	2
1.2.2	Response surfaces . . . . .	3
1.2.2.1	Types of response surfaces . . . . .	4
1.2.2.2	Principles of selecting the next evaluation point . . . . .	5
<b>2</b>	<b>Optimization methods for expensive problems</b>	<b>7</b>
2.1	Surface methods . . . . .	7
2.2	Surface methods with radial basis functions . . . . .	8
2.3	Gutmann's RBF method . . . . .	9
2.3.1	The interpolating model . . . . .	9
2.3.1.1	Radial basis functions and positive definiteness of functions . . . . .	12
2.3.1.2	A system of linear equations to be solved . . . . .	14
2.3.2	A measure of bumpiness . . . . .	16
2.3.3	Auxiliary problems for the next sample point . . . . .	22

<b>3</b>	<b>An optimized choice of points to be evaluated</b>	<b>27</b>
3.1	The subproblems: Cheap global optimization problems . . . . .	28
3.2	Distances, properties of $\phi(r)$ and lower bounds for $s_n(x)$ . . . . .	31
3.2.1	Minimal and maximal distances . . . . .	32
3.2.2	Useful properties of $\phi(r)$ and lower bounds for $s_n(x)$ . . . . .	33
3.2.2.1	Gaussians, inverse multiquadrics, multiquadrics and cubic spline: Lower bounds for $s_n(x)$ . . . . .	33
3.2.2.2	Thin plate spline: Lower bounds for $s_n(x)$ . . . . .	35
3.3	Useful properties of the matrix $\Phi$ and the (inverse of the) matrix $A$ .	37
3.3.1	The behaviour of $\Phi$ . . . . .	37
3.3.2	Theoretical aspects concerning $A \neq \Phi$ . . . . .	39
3.4	Computation of lower bounds for the auxiliary problem and the weighted auxiliary problem . . . . .	46
3.4.1	Lower bounds if $A = \Phi$ . . . . .	46
3.4.2	Lower bounds if $A \neq \Phi$ . . . . .	50
3.4.2.1	Preliminaries . . . . .	50
3.4.2.2	Computing lower bounds . . . . .	52
3.5	The Branch and Bound algorithm . . . . .	57
3.5.1	The routine . . . . .	58
3.5.2	Convergence of the Branch and Bound algorithm . . . . .	61
<b>4</b>	<b>Box partitioning</b>	<b>65</b>
4.1	The problem . . . . .	65
4.2	General bisection of $d$ -dimensional rectangles . . . . .	66
4.2.1	The regular $d$ -dimensional rectangle . . . . .	67
4.2.2	A geometrical estimation . . . . .	69
4.2.3	General Rectangle . . . . .	70

<b>5</b>	<b>General convex constraints</b>	<b>75</b>
5.1	Scaling down rectangles . . . . .	76
5.2	The modified Branch and Bound algorithm . . . . .	78
<b>6</b>	<b>Numerical tests</b>	<b>81</b>
6.1	The implementation . . . . .	81
6.1.1	Initialisation . . . . .	81
6.1.2	Stopping criteria . . . . .	82
6.1.3	Cycles . . . . .	84
6.1.4	Solving the convex subproblems . . . . .	86
6.1.5	Sorting of boxes . . . . .	86
6.2	How to use the code . . . . .	86
6.2.1	Parameters for the input . . . . .	86
6.2.2	Reading the output . . . . .	88
6.3	Test instances and runtime . . . . .	88
6.3.1	Runtime . . . . .	89
6.3.2	Box constrained problems . . . . .	94
6.3.3	Results: Box constrained problems . . . . .	94
6.3.4	Box constrained problems with additional convex constraints .	94
6.3.5	Results: Problems with additional convex constraints . . . . .	99
<b>7</b>	<b>Conclusions</b>	<b>101</b>
<b>A</b>	<b>Testproblems</b>	<b>103</b>
	<b>Bibliography</b>	<b>107</b>
